The sandstone is medium to coarse-grained quartz sand with well-rounded pebbles of chert, mica, and shale. It is less than 3 feet thick and has been mined at several places to the east of the town of Brereton. The Oldtown Coal measures the massive sandstone into two benches in places. The Oldtown Coal is a black bituminous coal that is thin and laminated. The Mt. Rorah Coal is a fine-grained, open marine limestone. This limestone contains an open marine fauna consisting of brachiopods, crinoids, and bivalves. The unit occurs as discontinuous lenses and the paleogeographic setting is a shallow marine basin extending into shallower marine waters.
